Please find below and/or attached an Office communication concerning this application or proceeding.

	Application No.	Applicant(s)				
Office Astion Occurrence	10/786,176	RUBEN ET AL.				
Office Action Summary	Examiner	Art Unit				
	Eileen B. O'Hara	1646				
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply						
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 1 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

DETAILED ACTION

Election/Restrictions

- 1. Restriction to one of the following inventions is required under 35 U.S.C. 121:
 - I. Claims 1, drawn to nucleic acids, , classified in class 536, subclass 23.5.
 - II. Claim 2, drawn to polypeptides, classified in class 530, subclass 350.
 - III. Claims 3-4, drawn to antibodies to the polypeptides of Group II, classified in class530, subclass 388.22, for example.
 - IV. Claims 5, 9, 15 and 17, drawn to a method of treatment by administration of the polypeptides of Group II, classified in class 514, subclass 12, for example.
 - V. Claims 6, 11, 13, 14, 16 and 18, drawn to a method of treatment by administration of antibodies of Group III, classified in class 514, subclass 2, for example.
 - VI. Claims 7, 10, and 19-29, drawn to a method of diagnosis comprising contacting the polypeptides of Group II with a biological sample and assaying for binding, classified in class 436, subclass 501, for example.
 - VII. Claims 8 and 12, drawn to a method of diagnosis comprising contacting the antibodies of Group III with a biological sample and assaying for binding, classified in class 436, subclass 501, for example.

The inventions are distinct, each from the other because of the following reasons:

Inventions I, II, and III are independent and distinct, each from each other, because they are products which possess characteristic differences in structure and function and each has an independent utility that is distinct for each invention which cannot be exchanged.

The polynucleotide of Group I and the polypeptide of Group II the are patentably distinct for the following reasons: polypeptides, which are composed of amino acids, and polynucleotides, which are composed of purine and pyrimidine units, are structurally distinct molecules; any relationship between a polypeptide and polynucleotide is dependent upon the information provided by the nucleic acid sequence open reading frame as it corresponds to the primary amino acid sequence of the encoded polypeptide. Furthermore, searching the inventions of Groups I and II together would impose a serious search burden. In the instant case, the search of the polypeptides and the polynucleotides is not coextensive. The inventions of Groups I and II have a separate status in the art as shown by their different classifications. In cases such as this one where descriptive sequence information is provided, the sequences are searched in appropriate databases. There is also search burden in the non-patent literature. Prior to the concomitant isolation and expression of the sequence of interest there may be journal articles devoted solely to polypeptides which would not have described the polynucleotide. Similarly, there may have been "classical" genetics papers which had no knowledge of the polypeptide, but spoke to the gene. Searching, therefore, is not coextensive. Furthermore, a search of the nucleic acid molecules of Group I would require an oligonucleotide search, which is not likely to result in relevant art with respect to the polypeptide of Group II. As such, it would be burdensome to search the inventions of Groups I and II.

The polypeptide of **Group II** and the antibody of **Group III** are patentably distinct for the following reasons: while the inventions of both **Groups I and III** are polypeptides, in this instance, the polypeptide of **Group II** is a single chain molecule, whereas the polypeptide of **Group III** encompasses antibodies including IgG which comprises 2 heavy and 2 light chains containing constant and variable regions, including framework regions which act as a scaffold for the 6 complementary determining regions (CDRs) that function to bind an epitope. Thus, the polypeptide of **Group II** and the antibody of **Group III** are structurally distinct molecules; any relationship between a polypeptide of **Group II** and an antibody of **Group III** is dependent upon the correlation between the scope of the polypeptides that the antibody binds and the scope of the antibodies that would be generated upon immunization with a polypeptide.

In this case, the polypeptide of Group II is a large molecule which contains potentially hundreds of regions to which an antibody must bind, whereas the antibody of Group III is

Application/Control Number: 10/786,176 Page 4

Art Unit: 1646

defined in terms of its binding specificity to a small structure within the disclosed SEQ ID NO. Thus, immunization with the polypeptide of Group II would result in the production of antibodies outside the scope of Group III. Therefore, the polypeptide and antibody are patentably distinct.

Furthermore, searching the inventions of **Group II** and **Group III** would impose a serious search burden. The inventions have a separate status in the art as shown by their different classifications. A polypeptide and antibody which binds to the polypeptide require different searches. An amino acid search of the full-length protein is necessary for a determination of novelty and unobviousness of the protein. However, such a search is not required to identify the antibodies of **Group III**. Furthermore, antibodies which bind to an epitope of a polypeptide of **Group II** may be known even if a polypeptide of **Group II** is novel. In addition, the technical literature search for the polypeptide of **Group II** and the antibody of **Group III** is not coextensive, e.g. antibodies may be characterized in the technical literature prior to discovery of, or sequencing of, their binding target.

The polynucleotide of **Group I** and the antibody of **Group III** are patentably distinct for the following reasons: the antibody of **Group III** includes, for example, IgG which comprises 2 heavy and 2 light chains containing constant and variable regions, including framework regions which act as a scaffold for the 6 complementary determining regions (CDRs). Polypeptides, such as the antibody of **Group III** which are composed of amino acids, and polynucleotides, which are composed of nucleic acids, are structurally distinct molecules. Any relationship between a polynucleotide and polypeptide is dependent upon the information provided by the nucleic acid sequence open reading frame as it corresponds to the primary amino acid sequence of the encoded polypeptide. In the present claims, a polynucleotide of **Group I** will not encode an antibody of **Group III**, and an antibody of **Group III** cannot be encoded by a polynucleotide of **Group I**. Therefore, the antibody and polynucleotide are patentably distinct.

The antibody and polynucleotide inventions have a separate status in the art as shown by their different classifications. Furthermore, searching the inventions of **Groups I** and **III** would impose a serious search burden since a search of the polynucleotide of **Group I** would not be used to determine the patentability of an antibody of **Group III** and vice-versa.

Art Unit: 1646

Invention is I unrelated to each of inventions IV-VII. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different designs, modes of operation, and effects (MPEP § 802.01 and § 806.06). In the instant case, the nucleic acids are not used in the methods of the inventions.

Page 5

Invention II is related to each of inventions IV and VI as product and process of use. The inventions can be shown to be distinct if either or both of the following can be shown: (1) the process for using the product as claimed can be practiced with another materially different product or (2) the product as claimed can be used in a materially different process of using that product (MPEP § 806.05(h)). In the instant case the polypeptides can be used in the method of treatment of invention IV, but the polypeptides can also be used in a method of diagnosis of invention VI, which is a materially different method, having different methods steps and goals.

Invention II is unrelated to each of inventions V and VII. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the polypeptides of invention II are not used or defined in the methods of treatment or diagnosis with the antibodies of inventions V and VII.

Invention III is related to each of inventions V and VII as product and process of use. In the instant case the antibodies can be used in the method of treatment of invention V, but the antibodies can also be used in a method of diagnosis of invention VII, which is a materially different method, having different methods steps and goals.

Art Unit: 1646

Invention III is unrelated to each of inventions IV and VI. In the instant case the antibodies of invention III are not used or defined in the methods of treatment with the polypeptides of inventions IV and VI.

Inventions IV and V are each unrelated to the other. Though both of the inventions are methods of treatment, the compounds that are administered (polypeptide or antibody) are different from each other, have different structures, functions and therapeutic effects, and thus are patentably distinct.

Inventions VI and VII are each unrelated to the other. Though both of the inventions are methods of diagnosis by contacting a biological sample with a compound and assaying for binding, the compounds that are used in the binding assays (polypeptide or antibody) are different biological molecules that have different structures, functions and bind to different molecules in the biological sample, and thus are patentably distinct.

Inventions IV and V are unrelated to inventions VI and VII. The two groups of inventions are different because inventions IV and V are methods of treatment, while inventions VI and VII are methods of diagnosis by contacting a biological sample, and thus have different methods steps and goals.

Because these inventions are distinct for the reasons given above, have acquired a separate status in the art as shown by their different classification, and the search required for each group is not required for the other groups because each group requires a different non-patent literature search due to each group comprising different products and/or method steps, restriction for examination purposes as indicated is proper.

Art Unit: 1646

Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).

Rejoinder Under Ochiai/Brouwer

The examiner has required restriction between product and process claims. Where Applicant elects claims directed to the product, and a product claim is subsequently found allowable, withdrawn process claims that depend from or otherwise include all the limitations of the allowable product claim will be rejoined in accordance with the provisions of MPEP § 821.04.

Process claims that depend from or otherwise include all the limitations of the patentable product will be entered as a matter of right if the amendment is presented prior to final rejection or notice of allowance, whichever is earlier. Amendments submitted after final rejection are governed by 37 CFR 1.116; amendments submitted after allowance are governed by 37 CFR 1.312.

In the event of rejoinder, the requirement for restriction between the product claims and the rejoined process claims will be withdrawn, and the rejoined process claims will be fully examined for patentability in accordance with 37 CFR 1.104. Thus, to be allowable, the rejoined claims must meet all criteria for patentability including the requirements of 35 U.S.C. 101, 102, 103, and 112. Until an elected product claim is found allowable, an otherwise proper restriction

requirement between product claims and process claims may be maintained. Withdrawn process claims that are not commensurate in scope with an allowed product claim will not be rejoined. See "Guidance on Treatment of Product and Process Claims in light of In re Ochiai, In re Brouwer and 35 U.S.C. § 103(b)," 1184 O.G. 86 (March 26, 1996). Additionally, in order to retain the right to rejoinder in accordance with the above policy, Applicant is advised that the process claims should be amended during prosecution either to maintain dependency on the product claims or to otherwise include the limitations of the product claims. Failure to do so may result in a loss of the right to rejoinder.

Page 8

Further, note that the prohibition against double patenting rejections of 35 U.S.C. 121 does not apply where the restriction requirement is withdrawn by the examiner before the patent issues. See MPEP § 804.01.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Eileen B. O'Hara, whose telephone number is (571) 272-0878. The examiner can normally be reached on Monday through Friday from 10:00 AM to 6:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gary Nichol can be reached at (571) 272-0835.

The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Any inquiry of a general nature or relating to the status of this application should be directed to the Group receptionist whose telephone number is (571) 272-1600.
